

ABSTRACT:

Device with a human-machine interface.

- A device with a human-machine interface for use as a user control interface, particularly in an automotive environment, which temporarily makes an indication of the function of a control organ perceptible, when the user begins to actuate it, but has not yet definitively actuated it. The device with a human-machine interface
- 5 helps the user to find the right control organ, or warns about dangerous control organs. Moreover, ways of finding groups of control organs and verifying the setting of groups of control organs are made possible.
